Refund

Overview

When you place an order with our quick-commerce platform, we want you to feel completely confident that your money is safe and that you will receive exactly what you paid for. Whether you are ordering fresh fruits and vegetables for tonight's dinner, dairy products for your morning routine, household essentials for the week, or a last-minute snack for instant delivery, we understand that things do not always go as planned. Sometimes an item is out of stock, sometimes the quality is not what you expected, sometimes you change your mind, and sometimes technical issues cause payment problems. This comprehensive guide covers everything you need to know about refunds, from checking your refund status to understanding why a refund might be delayed, what partial refunds mean, how cancellation refunds work, what happens when a payment fails, how we handle duplicate charges, and the specific timelines and processes for wallet refunds, UPI refunds, and card refunds. We have also included detailed information about refund eligibility so you can understand exactly when and how you can request your money back. Our goal is to make every refund experience as smooth, transparent, and stress-free as possible, because your trust is the foundation of our service.

Refund Status

Understanding where your refund stands is one of the most common concerns our customers have, and we want to make this process completely transparent for you. After you request a refund or after we initiate one automatically due to an issue with your order, you will naturally want to know when the money will actually return to your account. The refund status is essentially a way for you to track this journey of your money back to you, and we have designed our system

to keep you informed at every step. When you first notice that a refund has been initiated, perhaps because your order of fresh mangoes and spinach was cancelled due to unavailability, or because your milk packet arrived damaged and you reported it, the status will typically show as initiated or processing. This means that our system has registered your refund request and has begun the process of sending the money back through the same payment method you used originally. If you paid using your digital wallet, the status might move to completed within a few minutes to a few hours, depending on the wallet provider's processing speed. If you used UPI, the status will usually show processing for up to five to seven business days, as UPI refunds require coordination between multiple banking systems. For card payments, whether debit or credit, the status might remain in processing for seven to fourteen business days, because card networks and banks have their own verification and settlement timelines. You can check your refund status at any time through the order details section of our app, where each refund is listed with its current status and an estimated completion date. It is important to remember that the status you see on our platform reflects our side of the process, but the actual crediting of your account also depends on your bank or payment provider. For example, if you ordered household essentials like detergent and toilet paper for scheduled delivery next week, but cancelled the order because your plans changed, and the refund status shows completed on our end but you do not see the money in your account yet, this usually means the bank is still processing it. In such cases, we recommend waiting the full estimated period before becoming concerned. Another common scenario involves instant delivery orders, where you might order ice cream and cold drinks for a party starting in thirty minutes, but the delivery is delayed beyond usefulness and you refuse the order. The refund status in this case would be initiated immediately, and you would see real-time updates as it moves through the system. Sometimes customers ask what happens if the status seems stuck on initiated for longer than expected. This can happen during weekends or bank holidays when financial institutions are closed, or during high-volume periods like festival seasons when banks process transactions more

slowly. If your refund status has not changed for more than ten business days, and the estimated completion date has passed, that would be an appropriate time to reach out for assistance through our in-app help section. We also want to clarify that refund statuses are updated automatically by our system, so you do not need to take any action to move the process forward. Simply keeping an eye on the status and being patient is usually all that is required. For grocery orders containing multiple items, such as rice, lentils, cooking oil, and spices, if only one item is refunded, you will see a separate refund status for that specific item within the same order, which helps you track exactly which part of your payment is being returned. This granular tracking is especially useful for large orders where you might have twenty or thirty items, and only one or two had issues. We understand that waiting for a refund can feel uncertain, which is why we have invested in making the status tracking as detailed and accessible as possible, so you always know exactly where your money is in the return journey.

Refund Delayed

It can be frustrating when you are expecting a refund and it takes longer than anticipated, so let us explain why delays happen and what you can do about them. A refund delay occurs when the money you are owed does not reach your account within the standard timeframe we provide, and while this is never ideal, it is usually due to factors outside our direct control. The most common reason for delayed refunds is the processing time required by banks and payment networks. When we initiate a refund, the money leaves our system immediately, but it then must travel through various financial intermediaries before reaching you. For example, if you ordered fresh vegetables like tomatoes, onions, and potatoes for same-day delivery, but the order was cancelled because the delivery partner could not reach your location, and you paid by credit card, the refund might take up to fourteen business days because your card issuer needs to verify and post the transaction. During this journey, the refund might be delayed at any intermediary point, especially if there are weekends or public holidays

in between. Another frequent cause of delay is when the original payment method is no longer active. If you paid using a UPI ID linked to a bank account that you have since closed, or if you used a debit card that has expired and been replaced by your bank, the refund might bounce back to us or get stuck in the banking system. In such cases, we will detect the failure after a certain period and reach out to you to arrange an alternative refund method, such as transferring to a different account or adding the amount to your wallet balance. Sometimes customers experience delays because they are checking the wrong account or payment method. If you have multiple bank accounts, UPI IDs, or cards, it is worth verifying that you are looking at the same one you used for the original payment. For instance, if you ordered dairy products including cheese, butter, and yogurt for scheduled morning delivery, and you used a specific UPI app for payment, but you are checking your primary bank account statement for the refund, you might miss it because the money will return to the UPI app's balance or the linked account associated with that specific transaction. High transaction volumes can also cause delays, particularly during major sales events or festival seasons when banks handle millions of extra transactions. During Diwali or New Year periods, for example, when many customers order sweets, dry fruits, and festive groceries, refund processing across the entire banking ecosystem can slow down by a few days. Technical issues, though rare, can also contribute to delays. If there is a temporary glitch in the payment gateway or banking network when we send the refund, the transaction might fail silently and need to be retried, which adds to the timeline. We monitor for such failures and automatically retry, but this can add two to three business days to the process. If your refund is delayed beyond the maximum expected timeframe, which is typically fourteen business days for card payments and seven business days for UPI, we recommend checking your original payment method carefully, including any wallet balances or linked accounts you might have forgotten about. If after thorough checking you still cannot locate the refund, you can use our in-app help feature to report the delay, and we will investigate by tracing the transaction through the banking network. We take delayed refunds seriously because we know that every rupee

matters to our customers, whether you are a student ordering instant noodles and snacks on a tight budget, or a family stocking up on monthly groceries worth several thousand rupees. Our system flags unusual delays automatically, and in most cases, we can resolve them quickly once we identify where the money got held up.

Partial Refund

A partial refund is when you receive back only a portion of your total order amount, and this happens more often than you might think, so it is important to understand exactly how and why it occurs. The most common scenario for a partial refund is when one or more items in your order are unavailable, damaged, or incorrect, but the rest of your order is delivered successfully. Imagine you ordered a large grocery haul including rice, wheat flour, cooking oil, a variety of spices, fresh apples and bananas, a carton of milk, and some household cleaning supplies. If everything arrives perfectly except the milk, which is past its expiration date, we will initiate a partial refund for only the milk and any associated delivery fees specific to that item, while the rest of your payment remains with us because you received those items. This is different from a full refund where the entire order amount is returned to you. Partial refunds are also common when there are weight discrepancies in fresh produce. If you ordered one kilogram of tomatoes but only eight hundred grams were available, you would receive a partial refund for the two hundred grams that could not be fulfilled. Similarly, if you ordered a specific brand of detergent but we delivered a different size or variant by mistake, and you choose to keep it rather than return the entire order, the price difference would be refunded as a partial refund. Another situation where partial refunds apply is when promotional discounts or coupons are involved. If you used a buy-one-get-one-free offer on snacks, but one of the items was out of stock, the partial refund would be calculated based on the promotional price you actually paid, not the full retail price. This can sometimes cause confusion because customers might expect a higher refund amount, but our system always refunds exactly what you were charged for the affected item. For instant delivery orders, partial

refunds are particularly relevant because speed sometimes means substitutions or omissions. If you order cold beverages, chips, and ice cream for immediate delivery, and the ice cream is unavailable, you will get a partial refund for the ice cream while still receiving the beverages and chips. The refund amount will appear in your payment method within the same timelines as full refunds, depending on whether you used a wallet, UPI, or card. It is also worth noting that partial refunds can accumulate. If you place a scheduled delivery order for the week ahead, including breakfast cereals, bread, eggs, juice, and fresh vegetables, and multiple items have issues over the course of the delivery, you might see several partial refunds processed for the same order, each with its own tracking and timeline. Our app clearly shows which items were refunded and why, so you can always verify that the amount is correct. Some customers wonder if they need to do anything special to receive a partial refund, and the answer is no. If our delivery partner reports an issue, or if you report a problem through the app within the specified time window, the partial refund is initiated automatically once the issue is verified. You do not need to return the other items in your order or take any complicated steps. We also handle partial refunds for orders where you used multiple payment methods. If you paid part of the amount from your wallet and part by UPI, the partial refund will be split proportionally back to the same methods. Understanding partial refunds helps set the right expectations and reduces worry when you see a refund amount that is less than your total order value.

Cancellation Refund

When you cancel an order, whether by choice or due to circumstances beyond your control, the refund process is straightforward, but there are nuances depending on when and why the cancellation happens. If you cancel your order before it has been processed by the store, which typically means within a few minutes of placing it, you will receive a full cancellation refund immediately or within minutes, because no resources have been allocated to fulfill your order yet. For example, if you accidentally ordered two kilograms of rice instead of one, and you

cancel within two minutes of placing the order, the entire amount returns to your payment method almost instantly. However, if your order has already been packed or is out for delivery, the cancellation refund might take the standard refund timeline because the store may have already incurred costs in preparing your items. If you ordered fresh fruits like mangoes, papayas, and grapes for same-day delivery, and you cancel after the store has already started packing, we might need to verify the cancellation status before processing the refund, which could add a short delay. There are also situations where we cancel the order on your behalf, such as when an item is out of stock and no suitable substitute is available. In these cases, you automatically receive a full cancellation refund without needing to request it. If you ordered a specific brand of organic milk and artisan cheese for morning delivery, but the store informs us that these items are unavailable and you indicated no substitutions are acceptable, we will cancel the affected items or the entire order and initiate the refund immediately. For scheduled delivery orders, cancellation policies are more generous because you are planning ahead. If you ordered household essentials like toilet paper, dish soap, and laundry detergent for delivery three days later, and you cancel a day in advance, you will receive a full refund without any questions. However, if you cancel a scheduled delivery very close to the delivery window, after the store has already prepared your order, the refund might still be full but could take slightly longer to process because of the verification steps involved. Some customers ask what happens if they cancel an order after delivery has started. In most cases, if the delivery partner is already at your doorstep or very close, cancellation might not be possible through the app, and you would need to accept the order and then report any issues separately for a refund. However, if you refuse delivery for a valid reason, such as the order being completely wrong or the delivery being unacceptably late, this is treated as a delivery issue rather than a cancellation, and the refund process follows the standard refund protocols for problematic deliveries. Another important aspect of cancellation refunds is what happens to promotional discounts. If you used a coupon that gave you twenty percent off on a minimum order value, and you cancel the order, the

coupon is typically returned to your account for future use, unless it was a one-time promotional code with specific terms. The refund amount will always be what you actually paid, not the pre-discount total. For instance, if your grocery order of vegetables, lentils, and cooking oil was worth one thousand rupees but you paid eight hundred after a discount, your cancellation refund will be eight hundred rupees. We also want to address a common concern about cancellation refunds for instant delivery orders. Because these orders are prepared and dispatched extremely quickly, sometimes within minutes, the window for cancellation is very short. If you order ice cream, soft drinks, and chips for a party starting in fifteen minutes, and you change your mind after five minutes, the order might already be on its way, making cancellation impossible. In such cases, you would need to accept the delivery and then request a return if applicable, though perishable items like ice cream cannot be returned once delivered for food safety reasons. Understanding these timelines helps you make informed decisions about when to cancel and what to expect regarding your refund.

Payment Failed

A payment failure occurs when your transaction does not complete successfully, and understanding what happens next is crucial because it affects whether money leaves your account and how quickly it is returned to you. When you place an order for groceries, fresh produce, dairy, or household items, and you see a payment failed message, it means that the communication between our payment system and your bank or wallet provider was interrupted or rejected. The most important thing to know is that if a payment fails, no money is actually deducted from your account in most cases, or if it is deducted, it is automatically reversed within a short period. For example, if you are ordering your weekly supply of vegetables including cauliflower, carrots, beans, and spinach, along with milk and bread, and your UPI payment fails due to a network timeout, the amount might appear as debited in your bank SMS, but this is usually a temporary hold placed by your bank. Within a few minutes to a few hours, this hold is automatically released, and the

money returns to your account without any action from you. However, if the hold is not released within twenty-four hours, which can happen with certain banks during system maintenance, you should check with your bank first, as they are the ones who can release the hold. Payment failures can happen for many reasons beyond network issues. If your card has insufficient funds, if you entered your UPI PIN incorrectly, if your wallet balance is lower than the order total, or if your bank has placed a temporary security block on online transactions, the payment will fail. For large orders, such as stocking up on monthly groceries including rice, flour, pulses, cooking oil, snacks, and household supplies, some banks require additional verification for high-value transactions, and if this verification is not completed within the time limit, the payment fails. When a payment fails during checkout, your order is not placed, and you will need to retry the payment or choose a different payment method. If you used a wallet and the payment failed, the money never left your wallet, so there is no refund to process. If you used a card and the payment failed but your bank statement shows a deduction, this is almost always a pending authorization that will drop off automatically. The timeframe for this automatic reversal depends on your card issuer, ranging from immediately to five business days. For UPI payments, the reversal is usually faster, often within minutes, because UPI is designed to handle failed transactions efficiently. A special case occurs when a payment fails but you receive a confirmation that the order was placed. This can happen due to a rare technical glitch where our system processes the order before receiving the final payment confirmation. In such cases, we will either cancel the order automatically and refund any deducted amount, or we will fulfill the order and you can pay on delivery if that option is available in your area. If you are ordering instant delivery items like cold beverages and snacks for immediate consumption, and your payment fails, you might want to quickly retry with a different method so you do not lose time. For scheduled deliveries, where timing is less critical, you have more flexibility to investigate why the payment failed and try again later. Some customers worry that multiple failed payment attempts might lock their account or card, but we do not penalize customers for payment failures. Your account remains in good standing, and you can

retry as many times as needed. However, if you notice repeated payment failures across different methods, it might indicate an issue with your bank account or a temporary problem with our payment gateway, in which case waiting a short while before retrying is advisable. We continuously monitor payment failure rates to identify and resolve systemic issues quickly, because we know that a smooth checkout experience is essential, especially when you are ordering perishable items like fresh fruits and dairy that need to arrive quickly.

Duplicate Charge

Discovering that you have been charged twice for the same order can be alarming, but we want to assure you that duplicate charges are rare and when they do occur, they are resolved quickly and fully. A duplicate charge happens when your account is debited two or more times for a single order, and this is usually caused by a technical glitch during the payment process, such as when you tap the pay button multiple times due to a slow network connection, or when there is a communication delay between our app and the payment gateway. If you ordered groceries including fresh vegetables, fruits, milk, and household essentials, and you notice two identical deductions in your bank statement, the first step is to check whether both charges are actual deductions or if one is merely a pending authorization. Sometimes banks show both a successful debit and a hold from the same transaction, and the hold disappears within a day or two. However, if both charges are genuine deductions, we will identify this automatically in most cases and initiate a refund for the duplicate amount without you needing to report it. For example, if you placed an order for instant delivery of cold drinks and ice cream for a gathering, and due to a network lag you were charged twice, our system will detect the duplicate transaction and refund the extra amount within two to five business days. If for some reason the automatic detection does not happen, you can report the duplicate charge through our in-app help, and we will investigate by cross-referencing your payment records with our transaction logs. We will need details such as the order ID, the exact amounts, and the timestamps of the duplicate

charges, so keeping your bank SMS or statement handy is helpful. Duplicate charges can also occur with scheduled delivery orders. Suppose you ordered a week's worth of breakfast items including bread, eggs, juice, and cereal, along with cleaning supplies, for delivery next Monday, and you see two identical charges. The resolution process is the same. We will verify that only one order exists in our system and that the duplicate payment is indeed an error, then process the refund for the extra amount. It is worth noting that duplicate charges are more common with certain payment methods than others. Card payments, especially when the network is unstable, can sometimes result in duplicate authorizations because the card network retries failed attempts. UPI payments are generally more resistant to duplicates because of the unique transaction reference numbers, but they can still occur if the UPI app itself retries a failed payment. Wallet payments rarely duplicate because the wallet balance is checked in real time. If you used a combination of payment methods, such as part wallet and part card, and you see a duplicate charge on the card portion, only the duplicated card amount will be refunded, while the wallet portion remains correct. We also want to address a related concern about duplicate orders. Sometimes customers accidentally place two separate orders within minutes of each other, perhaps because they forgot to add an item to the first order and placed a second one. In this case, you are not being charged twice for the same order, you are simply being charged for two different orders. If you no longer want the second order, you should cancel it through the app, and the cancellation refund will follow the standard process. True duplicate charges, where the same order ID generates multiple payments, are what we handle as described above. We understand that seeing extra money leave your account can cause stress, particularly if you are budgeting carefully for your monthly household expenses. That is why we prioritize resolving duplicate charges as quickly as possible, and in most cases, the extra amount is back in your account before you even notice it was gone.

Wallet Refund

When you choose to pay using your digital wallet, whether it is our platform wallet or a third-party wallet partner, the refund process is typically the fastest and most straightforward of all payment methods. Wallet refunds are usually processed within minutes to a few hours, and in many cases, the money is available for you to use again almost immediately. This makes wallets an excellent choice for customers who frequently order instant delivery items like snacks, beverages, or last-minute groceries, because if anything goes wrong, you can reorder right away using the refunded balance. If you ordered fresh fruits and vegetables for dinner preparation, but the delivery was cancelled due to weather conditions, and you paid using your wallet, the refund would typically hit your wallet balance within minutes, allowing you to place a new order with a different store or delivery slot without waiting. Wallet refunds are also convenient for scheduled delivery orders. If you ordered a large haul of household essentials including detergent, floor cleaner, dishwashing liquid, and toiletries for delivery next week, and you decided to cancel because you found the items cheaper elsewhere, the wallet refund would be instantaneous, and you could use that balance for any other purchase immediately. One important thing to understand about wallet refunds is that the money always returns to the same wallet you used for payment. If you paid using a third-party wallet like Paytm, PhonePe, or Amazon Pay, the refund goes back to that specific wallet, not to our platform wallet or directly to your bank account. This is an automatic process governed by payment regulations, and we cannot redirect wallet refunds to a different payment method. Some customers prefer to keep a balance in our platform wallet specifically for quick-commerce orders because it simplifies budgeting and makes refunds even faster. If you maintain a wallet balance and use it to pay for your dairy order of milk, curd, paneer, and cheese, any refund will simply add back to that same balance, and you will see the updated amount immediately in your wallet summary. Another advantage of wallet refunds is that they are not affected by bank holidays or weekends. Since the transaction happens entirely within the digital wallet ecosystem, without needing to pass through traditional banking networks, refunds process even on Sundays and public holidays when banks are closed. This is

particularly useful during festival times when you might be ordering sweets, dry fruits, and special groceries, and need quick resolution if something goes wrong. There is one scenario where wallet refunds can be slightly delayed, and that is when the wallet provider itself has technical issues. If the third-party wallet service is experiencing downtime or maintenance, the refund might be queued and processed once their system is back online. In such rare cases, the delay is usually no more than a few hours. We also want to clarify that wallet refunds do not incur any fees. If you paid one hundred rupees from your wallet and receive a full refund, you get exactly one hundred rupees back, with no deductions. For partial refunds, the same principle applies. If you ordered a mix of grocery items and only the fresh produce was refunded, the exact amount you paid for those vegetables and fruits returns to your wallet. If you used a combination of wallet balance and another payment method, such as paying fifty rupees from your wallet and the rest by UPI, only the wallet portion returns to your wallet, while the UPI portion follows the UPI refund timeline. Understanding these details helps you choose the best payment method for your needs and know exactly what to expect when a refund is necessary.

UPI Refund

UPI has become one of the most popular payment methods for quick-commerce orders in India, and understanding how UPI refunds work will help you manage your expectations when a refund is needed. When you pay for your order using any UPI app, whether it is Google Pay, PhonePe, Paytm, or your bank's own UPI application, the refund is always sent back to the same UPI ID or linked bank account that was used for the original payment. This is a regulatory requirement, and we cannot send a UPI refund to a different account or UPI ID. The standard timeline for UPI refunds is three to five business days, though many customers see the refund within twenty-four to forty-eight hours. If you ordered instant delivery items like cold beverages, chips, and chocolates for a movie night, and the order was cancelled because the store closed unexpectedly, the refund would be initiated immediately

and would typically appear in your bank account within a few days. For larger orders, such as a weekly grocery run including rice, lentils, flour, cooking oil, spices, fresh vegetables, and fruits, paid via UPI, the refund follows the same timeline regardless of the amount. One thing to keep in mind is that UPI refunds are processed in batches by the banking networks, so even if we initiate the refund on a Saturday, it might not be processed by your bank until the next business day. This means that if you are checking for your refund over a weekend, you might not see it until Monday or Tuesday. Another important aspect of UPI refunds is how they appear in your bank statement. They might not always show as a separate credit with the description refund. Sometimes they appear as a reversal of the original debit, which means the original transaction amount is reduced or removed from your statement, rather than a new positive entry appearing. This can cause confusion because you might be looking for a credit that does not exist in the expected form. If you are unsure whether a UPI refund has been processed, comparing your current balance with your expected balance is often more reliable than looking for a specific transaction label. For scheduled delivery orders, such as ordering dairy products and household essentials for delivery next week, UPI refunds work identically. If you cancel three days before delivery, the refund is initiated immediately and follows the standard UPI timeline. If the refund is delayed beyond five business days, which is rare but can happen due to banking network issues, you should first check with your bank because they have the most direct visibility into UPI transaction status. We can provide you with the UPI transaction reference number, which your bank can use to trace the refund. Some customers ask whether they need to accept a UPI refund or enter their PIN again, and the answer is no. UPI refunds are automatic and do not require any action from you. The money simply appears in your linked account. If you have multiple bank accounts linked to your UPI app, the refund will go to the specific account that was debited for the original payment, so it is important to check the correct account. For example, if you have both a savings account and a salary account linked to your UPI ID, and you paid for your order from the savings account, the refund will return there even if you primarily use the salary account. We

also want to mention that UPI refunds are just as secure as UPI payments. The same encryption and authentication standards apply, so you can be confident that your refund is processed safely. Whether you are ordering a small instant snack or a large monthly grocery haul, the UPI refund process remains consistent, reliable, and regulated by the National Payments Corporation of India.

Card Refund

Card payments, whether using debit cards or credit cards, are a trusted and widely used method for quick-commerce orders, and card refunds follow a specific process governed by the card networks and your issuing bank. When you pay for your order with a card, and a refund becomes necessary, perhaps because your fresh vegetable delivery was damaged in transit or your household essentials order was cancelled due to stock unavailability, the refund is sent back to the same card used for the original transaction. This is mandatory under card network rules, and we cannot send a card refund to a different card or to a bank account. The standard timeline for card refunds is seven to fourteen business days, making this the slowest refund method among the options we offer. This timeline is not controlled by us but by the card networks, such as Visa, Mastercard, RuPay, and the issuing banks. When we initiate a card refund, the money leaves our merchant account immediately, but it then travels through the card network to your bank, which must verify and post it to your account. For example, if you ordered a large grocery haul including rice, wheat flour, various lentils, cooking oil, spices, fresh fruits, and dairy products, and paid by credit card, but the entire order was cancelled due to a store closure, the refund would be initiated immediately but might take up to two weeks to appear on your card statement. Debit card refunds generally follow the same timeline, though some banks process them slightly faster. One important thing to understand about card refunds is how they appear on your statement. Unlike UPI or wallet refunds, card refunds often appear as a credit adjustment on your card statement rather than a separate deposit. If you use a credit card, the refund might reduce your outstanding balance rather than

increasing your available cash. If you have already paid your credit card bill for the cycle in which the original purchase was made, the refund might appear as a negative balance on your card, which you can use for future purchases or request your bank to transfer to your account. For debit cards, the refund increases your account balance, but it might not show as a distinct transaction if your bank merges it with the original debit as a reversal. This can make card refunds harder to track than other methods, so we recommend keeping your original order confirmation and comparing statements carefully. If you ordered instant delivery items like ice cream and cold drinks for immediate consumption, and the delivery was significantly delayed leading to a refund, the two-week timeline for card refunds might feel frustratingly long. This is why, for urgent orders, you might consider using a faster refund method like a wallet or UPI. However, many customers prefer cards for large orders because of reward points, cashback offers, or simply because it is their default payment method. For scheduled delivery orders, such as ordering a month's worth of household supplies including cleaning products, paper goods, and personal care items, the card refund timeline is the same. If you cancel well in advance, the refund is initiated immediately but still takes seven to fourteen business days. If your card has expired or been replaced between the time of order and the time of refund, the refund will usually still be processed to your old card number and then automatically transferred to your new card by your bank, though this can occasionally add a few extra days. If your card account has been closed entirely, the refund might bounce back to us, and we would then need to arrange an alternative refund method, which requires additional verification steps. We also want to clarify that card refunds do not incur any processing fees on our end. If you paid one thousand rupees by card and receive a full refund, you will receive exactly one thousand rupees back, though any reward points or cashback you earned on the original purchase might be reversed by your card issuer according to their own policies. Understanding the card refund timeline helps you plan accordingly and avoid unnecessary worry when a refund does not appear immediately.

Refund Eligibility

Understanding when you are eligible for a refund is essential because it helps you know your rights as a customer and sets clear expectations about what situations qualify for money back. Our refund eligibility policy is designed to be fair, transparent, and customer-friendly, covering a wide range of scenarios that can occur when ordering groceries, fresh produce, dairy, household essentials, and other items through our quick-commerce platform. You are eligible for a refund when an item you ordered is out of stock and no suitable substitute is available or acceptable to you. For example, if you ordered a specific brand of basmati rice, organic turmeric, or fresh Alphonso mangoes, and the store cannot fulfill that exact item, and you have indicated that you do not want substitutions, you will receive a full refund for that item. You are also eligible for a refund when the quality of delivered items does not meet reasonable expectations. Fresh produce is particularly susceptible to quality issues, so if your tomatoes are overripe and bruised, your spinach is wilted, or your bananas have brown spots beyond what is acceptable, you can request a refund within the reporting window specified in our app. Dairy products are another category where quality matters immensely. If your milk is sour, your curd is separated and watery, or your paneer smells off, you are eligible for a refund, provided you report the issue promptly after delivery. For household essentials, eligibility applies when you receive the wrong item, a damaged package, or a product that is clearly expired or near expiration. If you ordered a specific surface cleaner but received a different variant, or if your laundry detergent bottle was leaking upon arrival, these situations qualify for refund. You are also eligible for a refund when your order is significantly delayed beyond the promised delivery window, particularly for instant delivery orders where timeliness is the primary value proposition. If you ordered ice cream, cold beverages, and snacks for a party starting in thirty minutes, and the delivery arrives two hours later when the party is over, you are eligible for a refund because the order no longer serves its intended purpose. Similarly, for scheduled deliveries, if you ordered breakfast items including bread,

eggs, and juice for a specific morning delivery slot, and it arrives the next day instead, the delay makes the items less useful or unusable, and you are eligible for a refund. Cancellation refunds are available when you cancel your order within the allowed timeframe. For orders that have not yet been processed by the store, you can cancel at any time and receive a full refund. For orders that are already being prepared, cancellation might still be possible but could be subject to verification, and the refund will still be issued if the cancellation is confirmed. You are also eligible for a refund in cases of payment failures where money was deducted but the order was not placed, or in cases of duplicate charges where you were billed multiple times for the same order. These are technical issues for which you bear no responsibility, and refund eligibility is automatic. However, there are situations where refund eligibility is limited or does not apply. If you report an issue beyond the specified time window after delivery, which is typically a few hours for perishable items and twenty-four hours for non-perishables, we may not be able to verify the condition of the items at the time of delivery, and eligibility might be restricted. If you consumed or used a significant portion of an item before reporting a quality issue, refund eligibility might be reduced to a partial refund rather than a full refund. For example, if you ordered a two-liter bottle of cooking oil and used half of it before realizing it had an off taste, you would likely be eligible for a partial refund of the remaining amount rather than the full price. Custom or specially ordered items that were prepared specifically for you might not be eligible for refund if the issue is simply a change of mind rather than a quality or fulfillment problem. If you ordered a custom cake or a specially cut portion of meat, and you simply decided you no longer wanted it after delivery started, this would not typically qualify for refund unless there was a quality defect. Refund eligibility also requires that the items be reported through the proper channels within our app. Simply not accepting a delivery without reporting the reason through the app might delay or complicate eligibility determination. We need to know why you are refusing the order so we can categorize the issue correctly and process the appropriate refund. For high-value orders or orders with multiple items, eligibility is assessed on an item-by-item basis. If

you ordered twenty items and only one had an issue, you are eligible for a refund on that one item, not the entire order, unless the issue affects the entire order such as a complete delivery failure. We also want to address eligibility for promotional and discounted items. If you received a discount through a coupon or offer, your refund eligibility is based on the actual amount you paid, not the original price. If a buy-one-get-one offer was applied, and you are refunding one of the items, the calculation considers the promotional pricing structure. Understanding these eligibility criteria helps you make informed decisions about when to request a refund and what to expect. Our goal is to ensure that every legitimate refund request is honored promptly and fairly, because we value your trust and want you to shop with complete confidence, knowing that your satisfaction is guaranteed.
